

New Application Integration Guide

So you want to build an application which interacts with MeshDB data. Great!

First, familiarize yourself with the [data schema](#) that we use at a high level. You likely don't need to get into the intricacies of the various edge cases, but read the first section where we describe the high level relationship between the various tables. You probably also want to gain at least read-only access to the admin console so that you can see examples of the schema implemented for real data. Have a friendly admin follow [this guide](#) to give you access (or ask in [#meshdb](#) on slack).

Next, review our [API docs](#) to get a sense of the endpoints available and the format of the data your application can expect to receive. In order to get credentials, Have a friendly admin follow [this guide](#) to create the credentials (or ask in [#meshdb](#) on slack)
